# Content

- Why do we need CRS?
- Geographic Coordinate (Reference) Systems
- Projections
- UTM / LCC
- Projected Coordinate Reference Systems
- Examples: Europe, State Plane
- WKT
- EPSG
- PROJ

© [discworld.com](http://discworld.com) permission granted for this presentation

# Why do we need Coordinate Reference Systems?

- We need to locate points on the Earth (2D, 3D, 4D?) respect to a known reference.
- Common understanding of the **reference(s)**.
- Coordinates without a CRS are meaningless numbers.
- Coordinates with the wrong CRS are very confusing.
- When getting the wrong coordinate reference system [makes a lake go away.](#)

# Geographic Coordinate System

- Define the earth as Ellipsoid (of revolution) / Spheroid
- Coordinates as ([geodetic](#)) latitude ( $\phi$ ), longitude ( $\lambda$ )

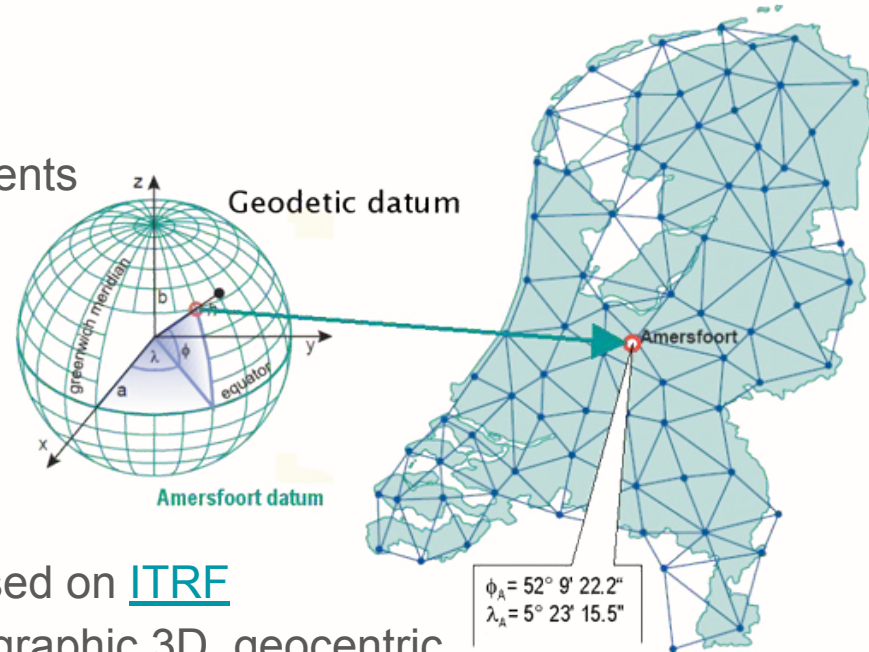

We need a well defined **Reference!**

# Geographic Coordinate (Reference) System

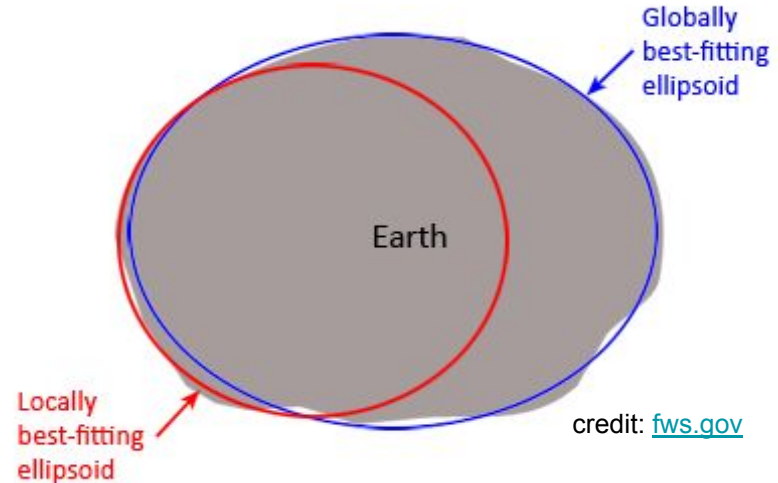

- **Datum**
  - Spheroid with size defined (R, e)
  - Location based on station measurements
- **Prime meridian** (usually Greenwich)
- **Unit** (usually degree)
- **Examples:**
  - WGS84 ([EPSG:4326](#)) - World
  - NAD83(2011) ([EPSG:6318](#)) - USA
  - ETRS89 ([EPSG:4258](#)) - Europe
- New ones (like the new NATRF2022) are based on [ITRF](#)
- May have 3 flavours: Geographic 2D, geographic 3D, geocentric

credit [un.org](#)

# Local or global ellipsoid

- Fitting an ellipsoid to the Real World™ is not easy
  - A datum that works in one location may not work somewhere else in the globe
  - Datum transformations are not always exact
- CH1903+ ([Swiss CRS](#)):
- Uses [Bessel 1841 Ellipsoid](#)
    - $a = 6,377,397.155$  m
    - $b = 6,356,078.963$  m
  - Axes about 700 m shorter
  - Offset of approx {674, 15, 405} m from WGS84
- Amersfoort ([Dutch CRS](#))
- Bessel Ellipsoid
  - Offset: {565, 50, 465} m and some rotation
- DHDN ([German CRS](#))

# Projections

© [Charles Preppernau](#)

# Projections

- Transform from 3D model (using only 2 coordinates) to 2D **flat** surface:  
*We can't please everyone.*
- Planar
- **Conical**
- **Cylindrical**
- ...other

It may conserve

- Areas
- Local angles (conformal)
- Distances (from one/two points)

[List of projections](#)

# Projections

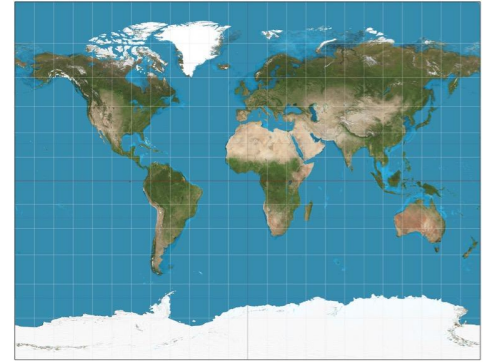

Mercator (1569)

Plate Carrée (AD 100)

Gall Stereographic (1855)

Lambert conformal conic (1772)

Robinson (1963)

Gall-Peters (1855)

# Conformal Projections: Plate Carrée vs Mercator

# Equirectangular projection

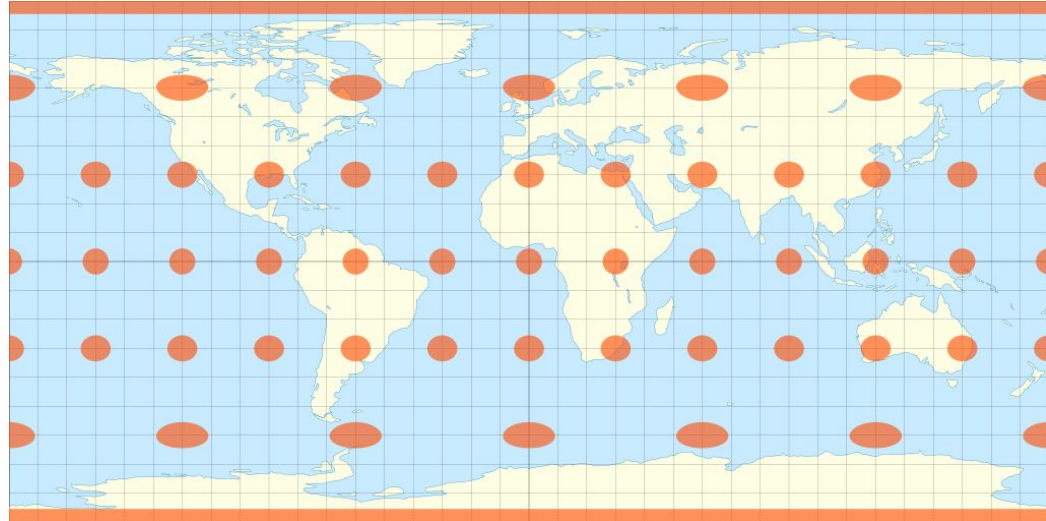

- Plate Carrée is a particular case.
- Neither equal area nor conformal.
- Formulas (sphere)
  - $x = R (\lambda - \lambda_0) \cos \varphi_1$       ⊙  $\lambda = \lambda_0 + x / (R \cos \varphi_1)$
  - $y = R (\varphi - \varphi_0)$               ⊙  $\varphi = \varphi_0 + y / R$
- Simplified formulas ( $\lambda_0=0, \varphi_0=0, \varphi_1=0, R=1$ )
  - $x = \lambda$
  - $y = \varphi$
  
  - QGIS uses this to display geographic systems

© [Strebe](#)

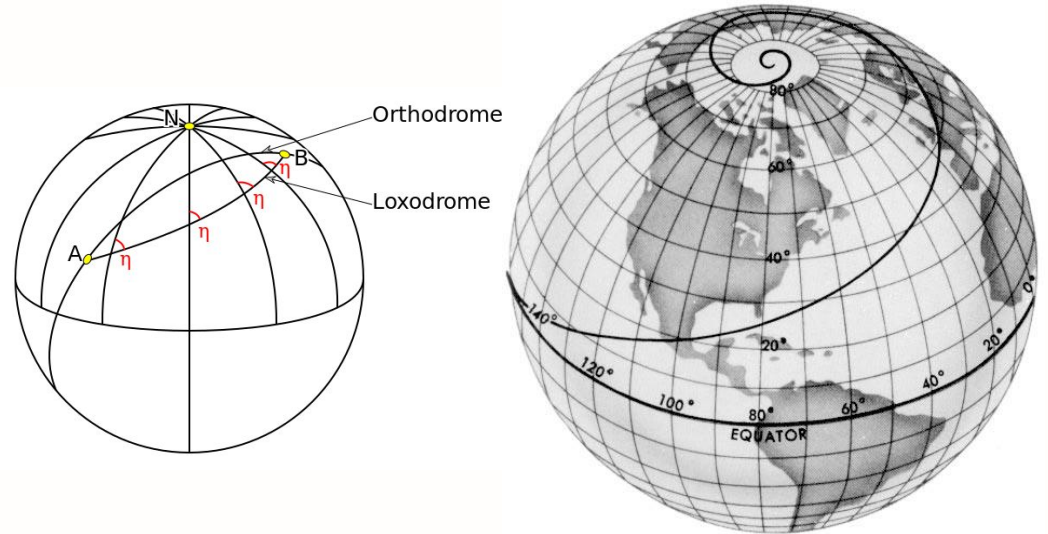

# Tissot's indicatrix

Tissot's indicatrix. All those ellipses represent the same circular shape and area in the Real World™

# Mercator projection

- Done in 1569 by [Gerardus Mercator](#).
- [Loxodromic](#) (rhumbline) curves are straight lines.
- Great for navigation!
- Poles are located at infinity.
- Conformal (keep angles).
- North is “up” for every point.
- <https://xkcd.com/2082/>

— Rhumb Line 3290 NM  
- - Great Circle 3150 NM

Mercator's  
[map](#) from  
1569

# Mercator projection

[Tissot's indicatrix.](#)

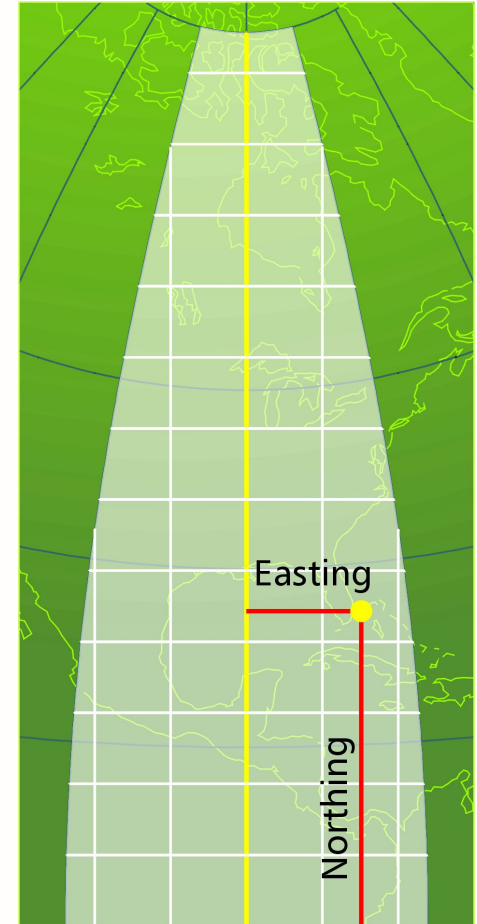

$$k = 1/\cos(\text{lat})$$

Play [TheTrueSize](#)

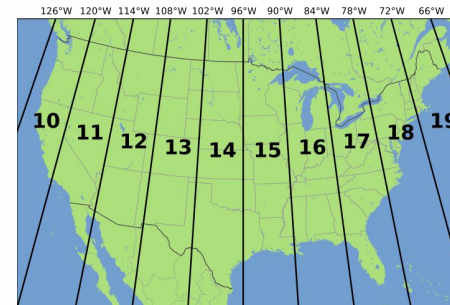

# Transverse Mercator Projection

- Like Mercator, but tangent at a meridian, not at the equator.
- Accurate near tangent line.
- Y axis is north only at central meridian or equator.

# UTM / Universal Transverse Mercator

- Transverse Mercator with 60 zones around the globe.
- 6° wide each zone.
- Not only in WGS84, but many other datums.
- To avoid negative values uses false northing and easting.
- Scale factor of 0.9996
- Valid between 84°N and 80°S.
- [UPS](#) in the poles.

# LCC / Lambert Conformal Conic

- One or two standard parallels
- Good for E-W maps
- Conformal: keep angles
- Small distance distortion
- Used in many State Plane CS
- Developed by [Johann Lambert](#)
- Used in aviation: a straight line approximates a great circle

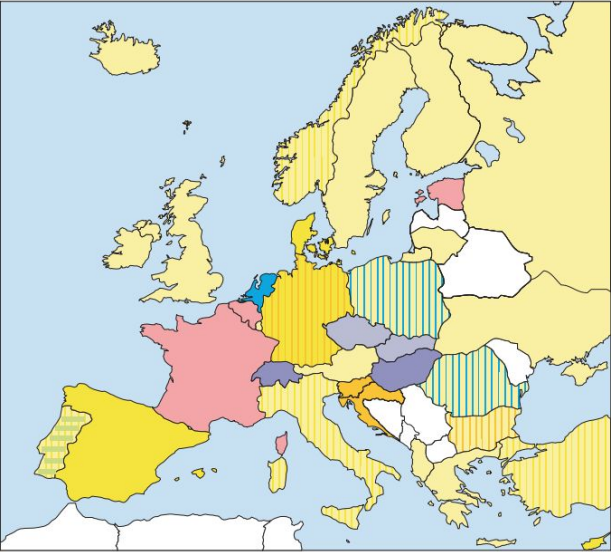

# Projected Coordinate Reference System

- Applies a projection with specific parameters **on a Geographic CRS**
  - v.g. Geographic ETRS89 + UTM projection with central meridian -123, false northing 0
- Different Geographic CRS produce different Projected CRS
- Length Units (m, ft, ftUS)
- Named as “{GeogCRS} / {Projection or Zone or Whatever} - VertCRS”
  - ETRS89 / UTM zone 30N
  - NAD83 / California zone 3 (ftUS)
  - KOSOVAREF01 / Balkans zone 7

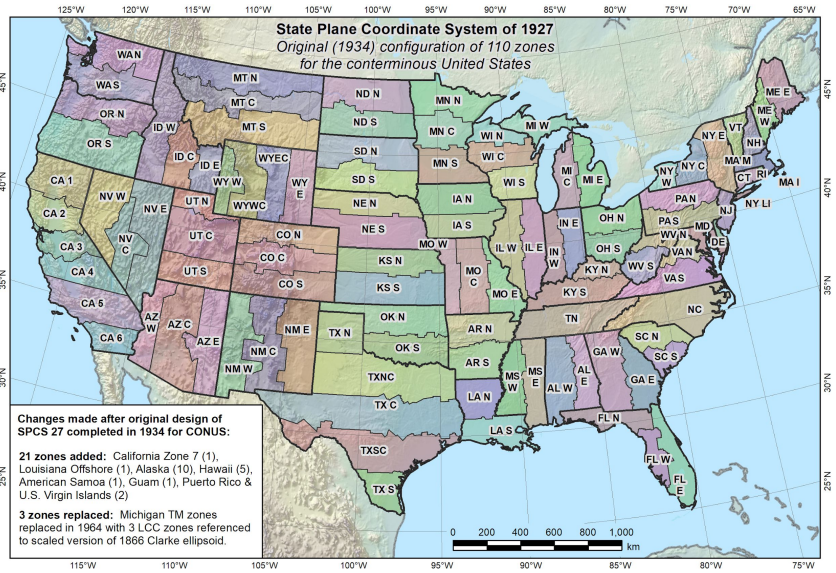

# Examples - Europe, USA

- Lambert Conformal Conic
- Oblique Conformal Conic
- Oblique Conformal Cylindric
- Oblique Stereographic
- Transverse Mercator
- Transverse Mercator (Gauss-Krüger-System)
- Transverse Mercator (UTM)
- Bonne

Distribution of Map Projections in Europe.

Projections used in Europe ([source](#))

State planes [ngs.noaa.gov](https://ngs.noaa.gov)

# EPSG

“European Petroleum Survey Group” <https://epsg.org/>

*The IOGP's EPSG Geodetic Parameter Dataset is a collection of definitions of coordinate reference systems and coordinate transformations. Maintained by the Geodesy Subcommittee of the IOGP Geomatics Committee.*

Database is updated regularly, even with new CRSs.

PROJ has 7300 PCRS, 5000 from EPSG; 1700 GCRS, 1000 from EPSG

- *EPSG:4326* WGS 84
- *EPSG:4258* ETRS89
- *EPSG:4269* NAD83
- *EPSG:6317* NAD83(2011)
- *EPSG:9140* KOSOVAREF01
- *EPSG:32632* WGS 84 / UTM zone 32N
- *EPSG:25830* ETRS89 / UTM zone 30N
- *EPSG:26910* NAD83 / UTM zone 10N
- *EPSG:6420* NAD83(2011) / California zone 3 (ftUS)
- *EPSG:9141* KOSOVAREF01 / Balkans zone 7

# WKT / Well Known Text

- Text to describe the CRS (there are WKT for other entities, like geometries)
- Versions WKT, WKT2, and some minor variants.
- Different software supports different versions.
  
- Axes chaos
  - Latitude - longitude vs X - Y vs Y - X.
  - Easting-Northing, Northing-Easting, Westing-Southing...
  - Some formats define the axes order (E-N), regardless anything else.

# WKT / Examples - GEOGCS

```
GEOGCS ["ETRS89",

# PROJ

<https://proj.org/>

<https://github.com/OSGeo/PROJ>

“PROJ is a generic coordinate transformation software that transforms geospatial coordinates from one coordinate reference system (CRS) to another. This includes cartographic projections as well as geodetic transformations.”

<https://crs-explorer.proj.org/>

# PROJ

- C/C++ library, used by other software like GDAL (used by QGIS)
  - Python bindings with [pyproj](#)
  - There was a big change in PROJ 6 respect to PROJ4. Update!
- 
- Information about CRS (CLI: [projinfo](#))
  - Transformations and projections: (CLI: [cs2cs](#), [projinfo](#), [cct](#), [proj](#))
  - Transformations using grid files ([PROJ-data](#)) 600 MB and growing
  - Helpful [mailing list](#)

# Thanks for watching!
